Canadian Data Report of Fisheries and Aquatic Sciences

Data reports provide a medium for filing and archiving data compilations where little or no analysis is included. Such compilations commonly will have been prepared in support of other journal publications or reports. The subject matter of data reports reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries and aquatic sciences.

Data reports are not intended for general distribution and the contents must not be referred to in other publications without prior written authorization from the issuing establishment. The correct citation appears above the abstract of each report. Data reports are abstracted in *Aquatic Sciences and Fisheries Abstracts* and indexed in the Department's annual index to scientific and technical publications.

Numbers 1–25 in this series were issued as Fisheries and Marine Service Data Records. Numbers 26–160 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Data Reports. The current series name was introduced with the publication of report number 161.

Data reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out-of-stock reports will be supplied for a fee by commercial agents.

Rapport statistique canadien des sciences halieutiques et aquatiques

Les rapports statistiques servent à classer et à archiver les compilations de données pour lesquelles il y a peu ou point d'analyse. Ces compilations auront d'ordinaire été préparées à l'appui d'autrès publications ou rapports. Les sujets des rapports statistiques reflètent la vaste gamme des intérêts et des politiques du ministère des Pêches et des Océans, c'est-à-dire les sciences halieutiques et aquatiques.

Les rapports statistiques ne sont pas destinés à une vaste distribution et leur contenu ne doit pas être mentionné dans une publication sans autorisation écrite préalable de l'établissement auteur. Le titre exact paraît au-dessus du résumé de chaque rapport. Les rapports statistiques sont résumés dans la revue *Résumés des sciences aquatiques et halieutiques*, et ils sont classés dans l'index annuel des publications scientifiques et techniques du Ministère.

Les numéros 1 à 25 de cette série ont été publiés à titre de relevés statistiques, Services des pêches et de la mer. Les numeros 26 à 160 ont été publiés à titre de rapports statistiques du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 161.

Les rapports statistiques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

INTRODUCTION

In 1982 a program was initiated to assess the utilization of the rehabilitated portion of the Campbell River estuary. British Columbia Forest Products constructed four intertidal islands to partially compensate for habitat lost to a new dry land log sort facility and dredged log pond (Brownlee et al. 1984). Beach seine surveys were used to provide data on the numbers, dispersal and migration of juvenile salmonids. The beach seine surveys were conducted yearly from 1982 to 1986 and are reported in Brown et al. 1983; 1984a, b; 1985 and 1986. A summary of this data is reported here.

MATERIALS AND METHODS

The sampling was carried out in three zones (Fig. 1). The estuarine zone was defined as an area bounded by Tyee Spit. The transition zone included an area of Discovery Passage that could be influenced by the Campbell River and the marine zone included the rest of Discovery Passage.

Eighty survey trips were made to Campbell River from March 1982 to August 1986 (Table 2). The fish were caught using a 13.7 m beach seine with 4.5 m wings, 4.6 m bunt (0.6 cm stretched mesh) and 3 m depth. Fifty-eight stations were occupied during the 5 year study. Duplicate sets were usually made at each station except for the sites on islands 1 and 3 in which grooves were seined and replicates were not required.

The catches were held in the bunt of the net or placed into a holding pen where counting or sub-sampling occurred. The sampled fish were preserved in 10% formalin for length weight and stomach analysis (Chang et al. 1984; Kotyk et al. 1983, 1984, 1985a, 1986a,b,c, in prep.; Gordon et al. 1983). The coded wire tags were read to determine release origin and residency of the hatchery fish (Levings et al. 1984; Kotyk et al. 1985b).

During the 80 sampling trips to Campbell River there were 6,223 beach seine sets made capturing 366,916 juvenile salmonids. A total of 151,579 juvenile chinook were examined from the three zones.

RESULTS

The original data included 58 stations, some of which were sampled only sporadically and therefore excluded from this summary report. The remaining stations were renumbered from 1 to 31 starting furthest up the river and ending at the most distant marine station (Table 3, 4; Fig. 2, 3). The 6

sites on island 3 were combined under the new station 12. The data set was further reduced by using only the first 16 sampling trips which occurred between March and September of each year.

The first calculations produced tables of catch per unit effort (CPUE) by trip, species and group. The catch at each station for each trip was summed by species and group and divided by the total number of sets at that station. The area swept by the beach seine was considered constant (100 m^2) except for the new estuarine stations 1, 6, 10, 11 and 12. The CPUE for these stations was converted to mean catch per 100 m^2 (CPUA) for each trip by applying the factors 0.50, 0.75, 0.40, 1.50 and 0.12 respectively. This produced Table 5 which gives mean CPUA for each trip and station by species.

The chinook data was further analysed by including the divisions of marked, unmarked hatchery, wild, unknown, and total chinook. These categories were decided upon in the field when the catch was identified and counted. If it is assumed that all the chinook marks (adipose clips) were all from the Quinsam hatchery then an estimate of total hatchery chinook (EHAT) can be obtained. The number of marked chinook was divided by the tag ratio released from the Quinsam hatchery for each trip. This gave an estimate of hatchery fish in the catch. If EHAT was greater than the total chinook then EHAT equalled the total chinook. The estimated wild chinook (EWILD) was then the difference between the total chinook and EHAT. These estimates are in numbers per 100 m^2 and presented in Table 5.

The length and weight data obtained from the samples collected has also been summarized (Chang et al. 1984; Kotyk et al. 1983, 1984, 1985, 1986a, b, c, in prep.; Gordon et al. 1983). The mean length, mean weight, standard deviations and the number of fish examined by species, trip and zone are presented in Tables 6 and 7. The size frequencies of unmarked chinook were plotted on a histogram and fish which did not match wild populations but compared favourably to the hatchery size distribution (marked chinook) were removed from the wild chinook calculations. The hatchery chinook means were obtained using marked chinook (adipose clips) only.

Thanks are due M. Marshall for her assistance in programing.
